Riad Oliveira de Moraes

Ricardo Cezar Fernandes de Melo Junior

Pedro David Rocha Saldanha

Vitor Duarte Bezerra de Oliveira

Arquivos .asm de testes e macros se encontram na pasta testeAssembly

Tarefa 1.1 - Criação da PCB do gerenciador de Processos

Pacote Mars.mips.SO foi criado conforme as requisições e contém os seguintes arquivos:

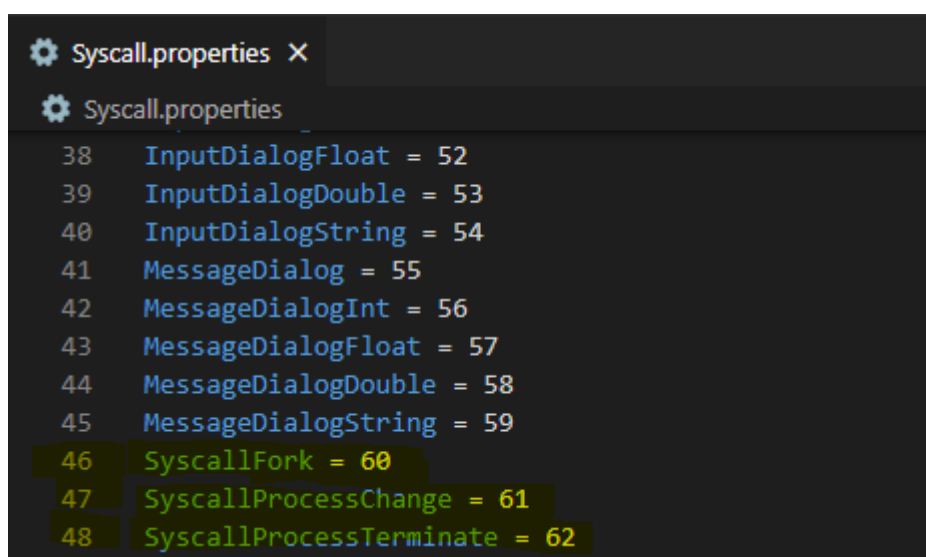

Prints das classes não foram adicionados pois o arquivo ficaria muito grande.

Tarefa 1.2 - Criação das Syscalls do gerenciador de Processos

Syscalls foram criadas no pacote "mars.mips.instructions.syscalls"

Cada uma das novas Syscalls ganhou seu próprio número no arquivo "Syscall.properties" (60, 61 e 62)

Primeira syscall - SyscallFork

```
SyscallFork.java X
mars > mips > instructions > syscalls > SyscallFork.java > SyscallFork
1 package mars.mips.instructions.syscalls;
2
3 import mars.ProcessingException;
4 import mars.ProgramStatement;
5 import mars.mips.SO.ProcessManager.ProcessesTable;
6 import mars.mips.hardware.RegisterFile;
7
8 public class SyscallFork extends AbstractSyscall {
9     public SyscallFork() {
10         super(number: 60, name: "SyscallFork");
11     }
12
13     @Override
14     public void simulate(ProgramStatement statement) throws ProcessingException {
15         ProcessesTable.criarProcesso(RegisterFile.getValue(num: 4), RegisterFile.getValue(num: 5));
16     }
17 }
```

Segunda syscall - SyscallProcessChange

```
SyscallProcessChange.java X
mars > mips > instructions > syscalls > SyscallProcessChange.java > {} mars.mips.instructions.syscalls
1 package mars.mips.instructions.syscalls;
2
3 import mars.ProcessingException;
4 import mars.ProgramStatement;
5 import mars.mips.SO.ProcessManager.Scheduler;
6 import mars.tools.PreemptiveScheduling;
7
8 public class SyscallProcessChange extends AbstractSyscall {
9     public SyscallProcessChange() {
10         super(number: 61, name: "SyscallProcessChange");
11     }
12
13     @Override
14     public void simulate(ProgramStatement statement) throws ProcessingException {
15         Scheduler scheduler = new Scheduler(PreemptiveScheduling.getAlgoritmoSelecionado());
16         scheduler.escalonar(encerrarProcesso: false);
17     }
18 }
```

Terceira syscall - SyscallProcessTerminate

```
SyscallProcessTerminate.java X
mars > mips > instructions > syscalls > SyscallProcessTerminate.java > {} mars.mips.instructions.syscalls
1 package mars.mips.instructions.syscalls;
2
3 import mars.ProcessingException;
4 import mars.ProgramStatement;
5 import mars.mips.SO.ProcessManager.Scheduler;
6 import mars.tools.PreemptiveScheduling;
7
8 public class SyscallProcessTerminate extends AbstractSyscall {
9     public SyscallProcessTerminate() {
10         super(number: 62, name: "SyscallProcessTerminate");
11     }
12
13     @Override
14     public void simulate(ProgramStatement statement) throws ProcessingException {
15         Scheduler scheduler = new Scheduler(PreemptiveScheduling.getAlgoritmoSelecionado());
16         scheduler.escalonar(encerrarProcesso: true);
17     }
18 }
```

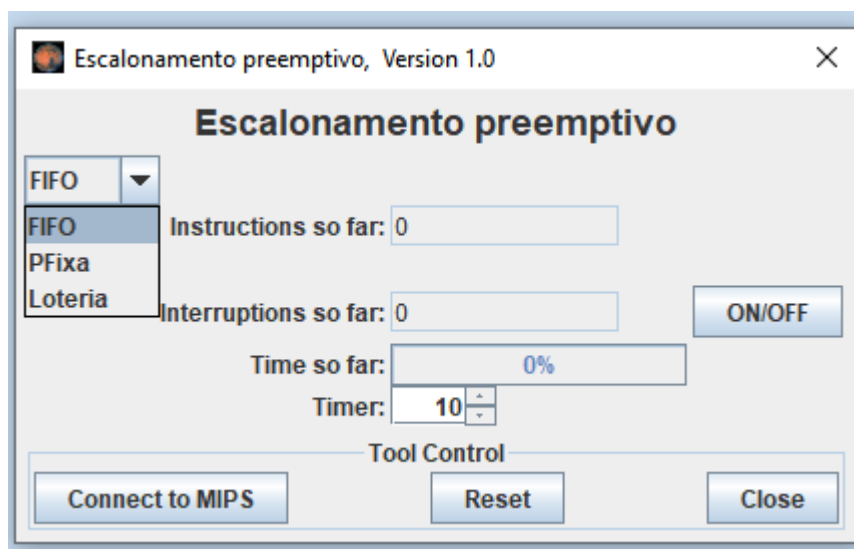

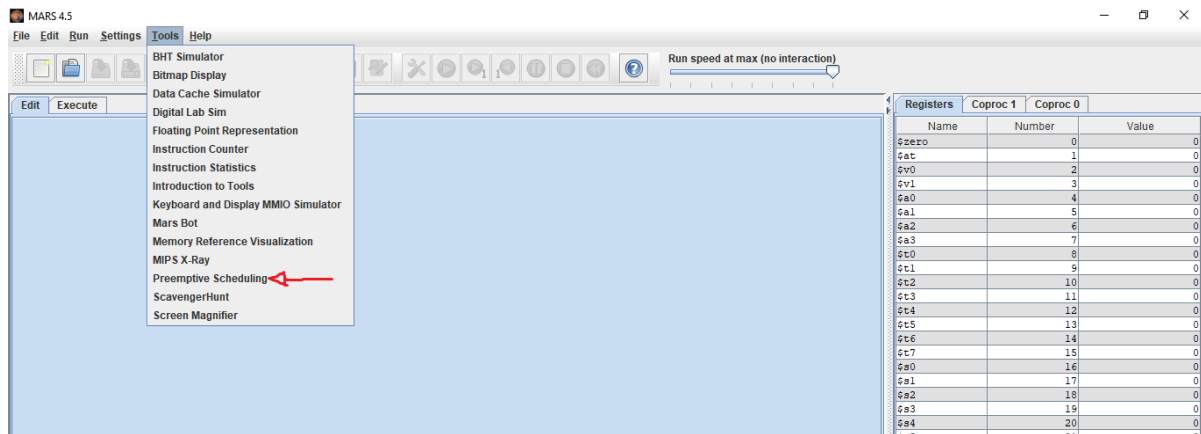

Arquivo macros.asm e o código de teste disponível na tarefa 1.2 se encontram na pasta testeAssembly (arquivos grandes para colocar prints)

Tarefa 1.3 - Criação das Syscalls do gerenciador de Processos

Parte 1 - Escalonamento Preemptivo

Criação de ferramenta (tool) do Mars que funcionará com timer:

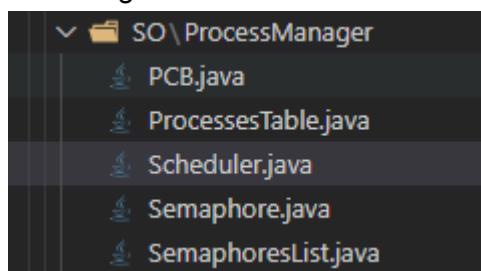

Arquivo de teste disponível na tarefa 1.3 se encontram na pasta testeAssembly (arquivo grande para colocar prints)

Parte 2 - Novos Algoritmos de escalonamento

Novos algoritmos foram criadas na classe Scheduler

```
private void prioridadeFixa() {
    criarFilasDePrioridade();
    PCB maiorPrioridade = obterProcessoPrioritario(altaPrioridade);

    if(maiorPrioridade == null) {
        maiorPrioridade = obterProcessoPrioritario(mediaPrioridade);

        if(maiorPrioridade == null) {
            maiorPrioridade = obterProcessoPrioritario(baixaPrioridade);
        }
    }

    int indexProcessoPrioritario = ProcessesTable.getListaProcessos().indexOf(maiorPrioridade);
    trocarPosicoesDaLista(indexProcessoPrioritario);
}

// Funções loteria.
private void loteria() {
    Random random = new Random();
    int valorAleatorio = random.nextInt(ProcessesTable.getTamanhoLista()-1)+1;

    trocarPosicoesDaLista(valorAleatorio);
}
```

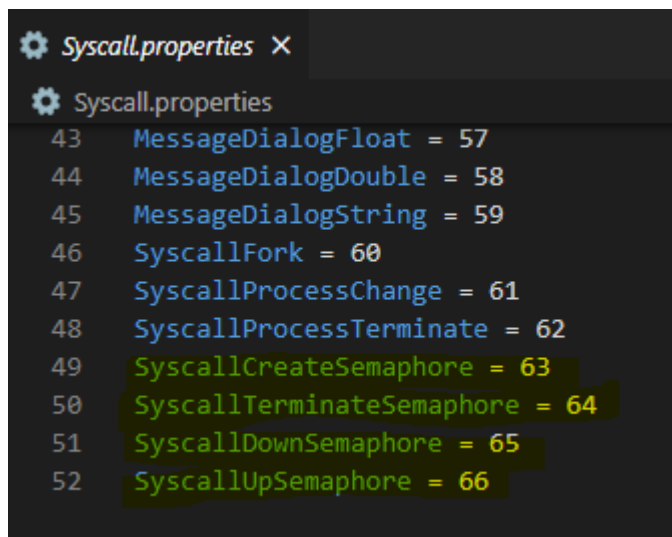

Arquivo de teste disponível na tarefa 1.3 se encontram na pasta testeAssembly (arquivo grande para colocar prints)

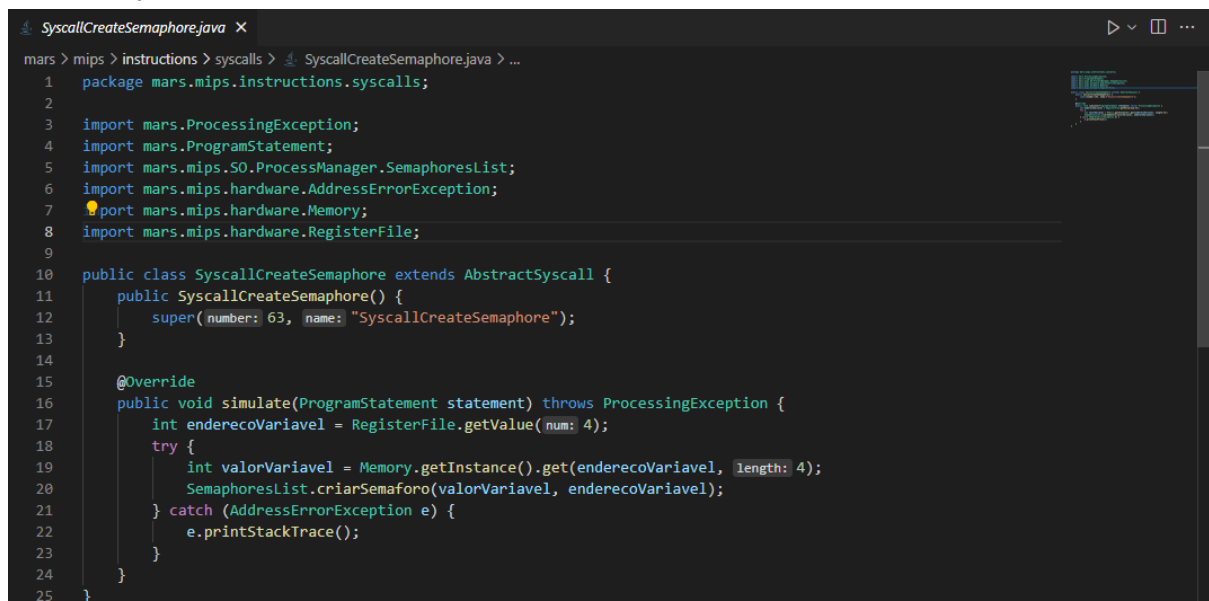

Tarefa 1.4 - Sincronização de processos por Semáforos

Syscalls foram criadas no pacote "mars.mips.instructions.syscalls"

Cada uma das novas Syscalls ganhou seu próprio número no arquivo "Syscall.properties" (63, 64, 65 e 66)

Primeira syscall - CreateSemaphore:

Segunda syscall - TerminateSemaphore:

```
SyscallTerminateSemaphore.java X
mars > mips > instructions > syscalls > SyscallTerminateSemaphore.java > SyscallTerminateSemaphore > SyscallTerminateSemaphore()
1 package mars.mips.instructions.syscalls;
2
3 import mars.ProcessingException;
4 import mars.ProgramStatement;
5 import mars.mips.SO.ProcessManager.Semaphore;
6 import mars.mips.SO.ProcessManager.SemaphoresList;
7 import mars.mips.hardware.RegisterFile;
8
9 public class SyscallTerminateSemaphore extends AbstractSyscall {
10     public SyscallTerminateSemaphore() {
11         super(number: 64, name: "SyscallTerminateSemaphore");
12     }
13
14     @Override
15     public void simulate(ProgramStatement statement) throws ProcessingException {
16         int enderecoVariavel = RegisterFile.getValue(num: 4);
17
18         try {
19             Semaphore semaforo = SemaphoresList.obterSemaforoPorEndereco(enderecoVariavel);
20             semaforo.eliminarLista();
21         } catch (Exception e) {
22             e.printStackTrace();
23         }
24     }
25 }
```

Terceira syscall - DownSemaphore:

```
SyscallDownSemaphore.java X
mars > mips > instructions > syscalls > SyscallDownSemaphore.java > {} mars.mips.instructions.syscalls
4 import mars.ProcessingException;
5 import mars.ProgramStatement;
6 import mars.mips.SO.ProcessManager.Semaphore;
7 import mars.mips.SO.ProcessManager.SemaphoresList;
8 import mars.mips.hardware.RegisterFile;
9
10 public class SyscallDownSemaphore extends AbstractSyscall {
11     public SyscallDownSemaphore() {
12         super(number: 65, name: "SyscallDownSemaphore");
13     }
14
15     @Override
16     public void simulate(ProgramStatement statement) throws ProcessingException {
17         int enderecoVariavel = RegisterFile.getValue(num: 4);
18
19         try {
20             Semaphore semaforo = SemaphoresList.obterSemaforoPorEndereco(enderecoVariavel);
21             semaforo.decrementarValor();
22         } catch (Exception e) {
23             e.printStackTrace();
24         }
25     }
26 }
```

Quarta syscall - UpSemaphore:

```
SyscallUpSemaphore.java X
mars > mips > instructions > syscalls > SyscallUpSemaphore.java > {} mars.mips.instructions.syscalls
1 package mars.mips.instructions.syscalls;
2
3 import mars.ProcessingException;
4 import mars.ProgramStatement;
5 import mars.mips.SO.ProcessManager.Semaphore;
6 import mars.mips.SO.ProcessManager.SemaphoresList;
7 import mars.mips.hardware.RegisterFile;
8
9 public class SyscallUpSemaphore extends AbstractSyscall {
10     public SyscallUpSemaphore() {
11         super(number: 66, name: "SyscallUpSemaphore");
12     }
13
14     @Override
15     public void simulate(ProgramStatement statement) throws ProcessingException {
16         int enderecoVariavel = RegisterFile.getValue(num: 4);
17
18         try {
19             Semaphore semaforo = SemaphoresList.obterSemaforoPorEndereco(enderecoVariavel);
20             semaforo.incrementarValor();
21         } catch (Exception e) {
22             e.printStackTrace();
23         }
24     }
25 }
```

Arquivo de teste disponível na tarefa 1.4 se encontram na pasta testeAssembly (arquivo grande para colocar prints)

Validar Semáforo:
